In Red Bus/Blue Bus, adding another bus results in odd substitution patterns

In Red Bus/Blue Bus, adding another bus results in odd substitution patterns

This is because of the IIA property of multinomial logit models

In Red Bus/Blue Bus, adding another bus results in odd substitution patterns

This is because of the IIA property of multinomial logit models

One way to get around IIA is to nest the choice set

One way to get around IIA is to nest the choice set

Nesting maintains IIA at each level but breaks IIA across alternatives in different nests

One way to get around IIA is to nest the choice set
